

Wet Press Concrete Filters

Eco Filters, a UK-based company, is represented exclusively in South Africa by PMSA. The company has an extensive range of filters for use in the production of all types of wet pressed concrete products.

A particular feature of the filters is that they are compatible with all major types of wet press concrete machinery, whether single- or three-mould.

Eco Filters can manufacture filters in a range of sizes to suit specific requirements, while specific design requirements can also be accommodated, from logos to various finishes.

A normal production process to produce pressed kerbs, for example, utilises paper filters, which allows the water to flow through but keeps the fines intact, namely the sand and cement.

The wet mould process can now be used to produce a range of finishes and products in a traditional pressing machine.

There is an additional health and safety benefit as the filters are attached to the actual moulds, which means that the process is independent of human intervention. This speeds up the production process, boosting productivity and increasing end-product quality.
