

Pan Mixers

Industry experts attended the international product fair during September. A new range of Sermac concrete pumps was on display. The Italian company has become a market leader in its field. The Sermac truck-mounted concrete pump uses a special 'S' valve that guarantees greater outputs and smaller load loss.

Pan Mixers' general manager, Michael Dorner, notes that the high-performance pumping unit comprises a hydraulic pump combination that is mounted to a transfer shift-gear driver by the engine PTO system.

"The boom and pump are controlled via a proportional system distributor and all their functions are managed by radio remote control, with a variable regulation of the concrete output."
